SUMMARY

Software engineer at Amdocs India working at the intersection of AI systems and enterprise automation, building the infrastructure that lets LLM agents operate production telecom software end to end. Full-stack across React/Node.js , Express JS; ships independently to real users. Published at ICTCS 2024.

SKILLS

Languages	JavaScript (ES6+), SQL
Systems	Agentic systems design, JVM instrumentation, MCP tool surfaces, REST/SOAP API design
Frontend	React 18/19, Vite, Tailwind CSS
Backend	Node.js, Express, Oracle DB, MySQL, PostgreSQL
AI / Agentic	MCP (Model Context Protocol), LLM orchestration, prompt engineering
Cloud & Tools	AWS (Lambda, S3, DynamoDB), Vercel, Render, Git, Maven, Playwright

EXPERIENCE

Amdocs India	Software Engineering Associate Jul 2025 – Present Pune, India
- Built an AI automation system that operates the CRM the way a human would navigating menus, filling forms, and completing customer provisioning end to end. What used to take engineers 8 to 10 minutes of manual work now runs in 97 seconds, fully unattended. - Automated retail and telesales order flows using Playwright across different test environments. - Built a Cursor AI automation package so any team member can trigger complete CRM workflows from a plain English prompt, with no coding or technical setup required.	

Dtree Labs	Software Engineering Intern Jun 2024 – Aug 2024 Pune, India
- Developed React components for customer-facing web applications and worked on REST API integrations alongside senior engineers, contributing to design system standardization. - Translated design mockups into working React features, contributed bug fixes, and picked up the full cycle from PR review to production deploy firsthand.	

PROJECTS

Newspaper Distribution & Billing System	React 19 · MUI v6 · Express · MySQL · On-prem
- Built a production billing system for a live newspaper distribution agency, replacing their hand-written daily ledger; tracks copies, returns, payments, and running dues across 7 newspaper titles and multiple delivery agents, with printable invoices on demand. - Designed around the actual user: on-prem MySQL (no reliable internet), one-click .bat launcher (owner is not opening a terminal), router-per-feature Express backend that any developer can extend without reading through a monolith.	
InstantShare — Real-Time Peer File Relay	React 18 · Node.js · Socket.IO Live Repo
- Open it on two devices, share a room code, and transfer up to 50 MB. No accounts, no cloud storage, no install. Rooms clear automatically when both tabs close; files never touch a database. - Split across Vercel (React client) and Render (WebSocket server) because serverless runtimes terminate idle connections. Mid-transfer disconnects mark items as failed rather than dropping them silently.	
Serverless Stock Pattern Detection	AWS Lambda, S3, DynamoDB, API Gateway, Node.js, React.js
Event-driven AWS serverless pipeline that ingests real-time market data, applies pattern recognition algorithms, and surfaces actionable signals via a React dashboard eliminating always-on server costs.	
Last Time Since — Privacy-First Habit Tracker	React 19 · localStorage · Vercel Live Repo
A mobile tracker for how long it has been since you last did something, with nothing to sign up for and nothing stored on a server. Built without a backend by design; forward-compatible data model means it can grow over time without breaking anyone’s existing data.
